

Synopsis

The project is a proof of concept for an e-commerce website, mainly the buying of electronic goods such as cameras, mobile phones etc.

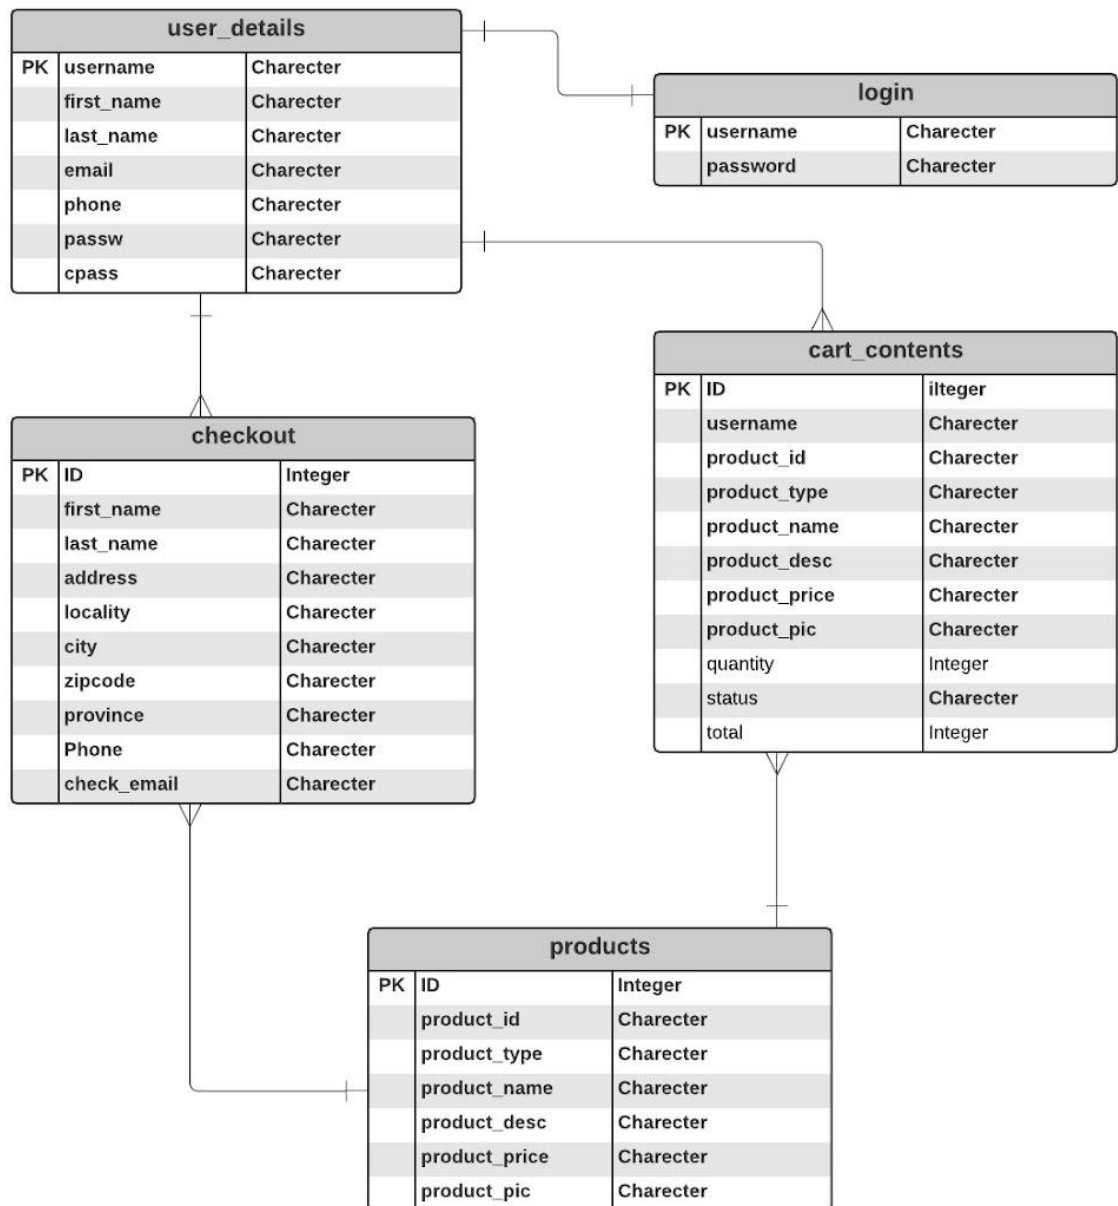

Users can sign up and login to browse the products. They can select which products they want add to cart. In case they change their mind they can always change the quantity or remove items from the cart. After updating and finalising their cart users can checkout.

Users enter the address details to where they want it delivered and take a look at the final bill before checking out. Users can manage their accounts and update any details they feel need to be changed. They can also take a look at their order history.

Please note that this is a project based on backend functionality using Django and not just web design, therefore these are all fully functioning web-pages. The server is hosted locally.
